Argentina's President Released from Hospital

10/11/2014

The president was released from the hospital because of the “good evolution of the case of sigmoiditis affecting her,” Dr. Marcelo Ballesteros and Dr. Daniel Fernandez said in a statement issued by the Office of the President.

Fernandez will “continue on an antibiotic treatment, special diet, rest and physical exams” at the Olivos presidential residence outside Buenos Aires, the doctors said.

The 61-year-old Fernandez was taken to the private Otamendi clinic last Sunday with a colon infection, known as sigmoiditis.

Fernandez has been advised to avoid “undertaking travel for 10 days,” the presidential medical team said.

The Argentine leader will not be able to attend the Nov. 15-16 G-20 Summit in Brisbane, Australia.
